

Project Management & Equipment Layout Review

If your intention is to develop an SMC, BMC or Compression Molding facility, LanKorra's experience in all these processes would provide you with a solid perspective that ensures success with your project.

Starting with the equipment placement and incoming deliveries, the storage of raw materials, material flow to the production line, your finished product inventory storage, and shipping area; LanKorra can assist and guide you through these areas for a smooth and productive work environment.

LanKorra will discuss the required or special ventilation needs, if an area should be enclosed and have ventilation of its own, or if specialized permits are required. We will also review and advise on the electrical layout, what areas need special explosion proof modifications, waste storage and other items.

Many times, items are forgotten when the Engineers, Developers and Owners look at the big picture. That is why LanKorra is here; to assist and provide you with the best workflow possible and point out the little things that can turn into headaches down the road.

Let's set up a meeting time to discuss our services further.
