

SMC Machine Diagnostics & Refurbishment

SMC Machines and ancillary equipment have a limited lifespan, and the slow wear of parts is difficult to measure. Excessive part wear, or improper operation will cause slow and hidden operational issues that are hard to pinpoint. Doktor Box Blades and Dynamic Mixers have an operational life timeframe that is critical to product quality. Maintaining the consumable parts and recognizing wear is critical in the machines performance.

LanKorra understands this and offers a **Complete Evaluation** of your SMC process starting with the Raw Material Mixing Equipment, through the SMC Machine, and the packaging process.

LanKorra's evaluation will identify any sub-standard, worn, or non-functioning equipment that ultimately affects the SMC quality and the functionality of the machine. We'll work closely with the Maintenance Dept., and Operators, to locate and identify any issues.

We'll stay with your team through the part replacement and start-up process, teaching the employees what to look for during the re-start, how to make any adjustments necessary, and how to measure the SMC product to produce a top-quality SMC that stays within the written specifications.
